

CUSTOMER CHURN FOR SYRIATEL

BY: STEPHEN JILANI

BUSINESS OVERVIEW

- ▶ SyriaTel has been experiencing customer churn and needs to build predictive models to predict customer churn and improve on customer retention.

BUSINESS OBJECTIVES

- ▶ To identify any patterns indicated by the data on customer churn.
- ▶ Build a predictive model that predicts whether a customer is expected to churn.
- ▶ To provide recommendations on what can be done differently to ensure customer retention.

DATA UNDERSTANDING

- ▶ The data was obtained from Kaggle and represents the Churn in SyriaTel's customers. This is the rate at which customers leave the company and end up procuring the services of competitors. The dataset contains data about customers ranging from the location of a customer, account numbers, minutes of calls across different service packages i.e local calls, international calls etc., telephone charges, customer churn etc.

DATA MODELLING AND EVALUATION

- ▶ 3 models were created on the dataset based on their suitability on the provided dataset and real-life scenarios.
- ▶ The final model selected indicated that the factors below are the major drivers of customer churn.
 - Total charges
 - Total minutes
 - Customer service calls
 - Average charge
 - Account length

BUSINESS RECOMMENDATIONS

- ▶ 1. The company should target customers with high total charges and employ retention measures like incentives so that they do not end up churning.
- ▶ 2. Clients with high amounts of minutes should also be targeted for retention measures.
- ▶ 3. Clients with high customer service calls also need to be addressed to reduce their churn rate.
- ▶ 4. Clients with higher average charge may need to be given incentivized packages to ensure retention
- ▶ 5. Target to reach out to clients as they approach more than 3 months with the company.

LIMITATIONS

- ▶ - The dataset may not consider all factors influencing churn like competitor pricing or behavior
- ▶ - Class imbalance may affect the performance of the model
- ▶ - The use of historical data which may not be applicable to the future.

THANK YOU
